

Create collaborative and adaptive workplaces that enhance your working experience. Function meets flexibility with a lightweight and clean aesthetic.

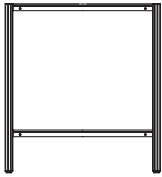

The fitz workstation is a highly versatile system based on vertical posts and interconnecting horizontal rails. The lightweight and modular system can be easily disassembled and reconfigured using rigid lock connectors.

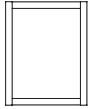

The quick installation time of the system is attributed to the 'design for disassembly' of the system, making it a highly sustainable and low impact product.

Power and data can reticulate through and be terminated within the system in numerous ways. Power can enter the system through powerpoles, umbilical cords (ceiling to desk or floor to desk) or directly from an adjoining wall. Power reticulates through the system in segregated cable trays, of which a variety are available. The services can then be terminated above or below desk, in various outlet quantities, in various different forms.

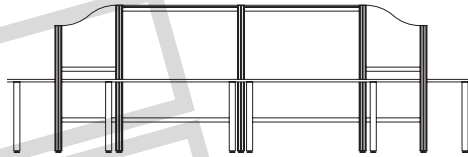

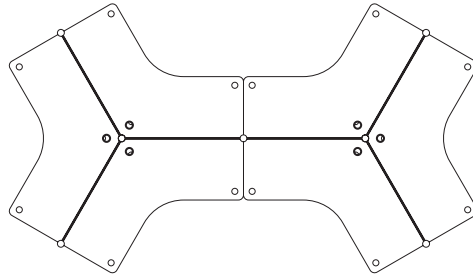

A variety of panel fascia is available to fit within the post and rail framework, including fabric wrapped panels, metal, glass, perspex, and laminates. An array of accessories are available to compliment the fitz system, be it adding storage, lighting or further functionality.
